

Morbidity and Mortality

Vol. 16, No. 3

WEEKLY
REPORTWeek Ending
January 21, 1967

U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE • PUBLIC HEALTH SERVICE

BUREAU OF DISEASE PREVENTION AND ENVIRONMENTAL CONTROL

CURRENT TRENDS MEASLES - 1967

A total of 1,451 cases of measles was reported for the 3rd week (ending January 21), an increase of 106 cases from the total of the previous week and 3,481 less than the total of 4,932 reported for the 3rd week in 1966. The three states reporting the highest numbers of cases are Texas with 322, Washington with 160, and California with 77. Six states reported no measles activity; 15 states notified at least one but fewer than 10 cases.

Figure 1 presents the reported cases of measles from the beginning of the epidemiologic year (week ending October 15) in comparison with the same period during the previous 3 years.

The counties reporting outbreaks of measles cases during the 6-week period ending January 14 are listed in Table 1. Five counties have been added by the criteria

Epidemiologic Notes and Reports	
Lactose-Fermenting Salmonella Infection - Michigan	18
Summary of Reported Cases of Infectious Syphilis	19

used: Washoe County, Nevada; Eastland, Ector, and Galveston Counties, Texas; and Clallam County, Washington. Since Table 1 was last published, the number of cases in four previously listed counties fell below the threshold and they are no longer included: Lane and Washington Counties, Oregon; Hutchinson County, Texas; and Snohomish County, Washington.

(Reported by the Childhood Viral Diseases Unit, Epidemiology Program, NCDC.)

*Criteria for outbreaks:

Population at least 1,000,000: 25 cases for 2 consecutive weeks.

Population 500,000 - 999,999: 20 cases for 2 consecutive weeks.

Population 100,000 - 499,999: 15 cases for 2 consecutive weeks.

Population less than 100,000: 10 cases for 2 consecutive weeks.

† Immunization program begun according to reports received by MMWR.

EPIDEMIOLOGIC NOTES AND REPORTS LACTOSE-FERMENTING SALMONELLA INFECTION - Michigan

Nine patients, all over 65 years of age, became acutely ill in early November 1966 while residing in a Wayne County, Michigan nursing home which houses approximately 100 patients. Symptoms consisted of diarrhea, low-grade fever (mean of 101.2°), and abdominal cramps. Vomiting was not a prominent feature of the symptom complex.

Two of the stool specimens obtained from patients contained organisms that gave a typical salmonella reaction when plated directly on bismuth sulfite agar, but when plated directly on MacConkey's and on Salmonella-Shigella media showed only lactose-fermenting colonies. Enrichment of these samples in tetrathionate brilliant green broth gave the same results when plated as before. The Salmonella Laboratory of the Michigan Department of Public Health typed these cultures as *Salmonella newington*.

Instant nonfat dry milk powder was suspected of being the vehicle of infection. A sample of this material

obtained for bacteriologic analysis from a stainless steel lined storage bin at the nursing home yielded a lactose-fermenting *S. newington*. Samples of dried milk obtained from the plant that processed the milk in question yielded the same organism.

The Enteric Bacteriology Unit of the Bacteriology Section, Laboratory Improvement Program, National Communicable Disease Center, received cultures from one of the patients and from milk in the nursing home, and confirmed the Michigan findings.

(Reported by Dr. George Pickett, Epidemiologist, Wayne County Health Department; and Dr. George H. Agate, Chief, Division of Epidemiology, Michigan Department of Public Health.)

Editorial Note: The frequency of occurrence of lactose-positive salmonellae is not precisely known. Ewing and (Continued on page 24)

LACTOSE-FERMENTING SALMONELLA INFECTION

(Continued from page 18)

Ball state that of approximately 400 unselected various salmonella serotypes examined for their biochemical reactions, 0.8 percent fermented lactose.¹ Seligmann and Saphra reported an organism which was biochemically classified as a coliform although it possessed the complete antigens of *S. newington*.² Kauffmann stated that lactose-fermenting variants of *S. anatum*, *S. newington*, *S. paratyphi B*, *S. typhi*, *S. typhi-murium*, *S. senftenberg*, *S. tennessee*, *S. ferlac*, and others have been encountered.³

Until the extent of this type of phenomena can be accurately determined, it is probably not necessary that laboratories isolating salmonellae use bismuth sulfite routinely. However, when salmonellosis is strongly suspected, but not isolated, the possibility of a lactose-fermenting variant should be considered, and proper media incorporated in the bacteriologic procedures.

THE MORBIDITY AND MORTALITY WEEKLY REPORT, WITH A CIRCULATION OF 17,000, IS PUBLISHED AT THE NATIONAL COMMUNICABLE DISEASE CENTER, ATLANTA, GEORGIA.

DIRECTOR, NATIONAL COMMUNICABLE DISEASE CENTER
CHIEF, EPIDEMIOLOGY PROGRAM
ACTING CHIEF, STATISTICS SECTION

DAVID J. SENCER, M.D.
A.D. LANGMUIR, M.D.
IDA L. SHERMAN, M.S.

IN ADDITION TO THE ESTABLISHED PROCEDURES FOR REPORTING MORBIDITY AND MORTALITY, THE NATIONAL COMMUNICABLE DISEASE CENTER WELCOMES ACCOUNTS OF INTERESTING OUTBREAKS OR CASE INVESTIGATIONS WHICH ARE OF CURRENT INTEREST TO HEALTH OFFICIALS AND WHICH ARE DIRECTLY RELATED TO THE CONTROL OF COMMUNICABLE DISEASES. SUCH COMMUNICATIONS SHOULD BE ADDRESSED TO:

THE EDITOR
MORBIDITY AND MORTALITY WEEKLY REPORT
NATIONAL COMMUNICABLE DISEASE CENTER
ATLANTA, GEORGIA 30333

NOTE: THE DATA IN THIS REPORT ARE PROVISIONAL AND ARE BASED ON WEEKLY TELEGRAMS TO THE NCDC BY THE INDIVIDUAL STATE HEALTH DEPARTMENTS. THE REPORTING WEEK CONCLUDES ON SATURDAY; COMPILED DATA ON A NATIONAL BASIS ARE RELEASED ON THE SUCCEEDING FRIDAY.
